

AI VISIBILITY · FIELD PROTOCOL

What do the assistants say about your company?

Most audits check whether your site *can* be read. This one checks what the machines actually *say*.

1 Why a site check is not enough

Readable is not the same as read correctly.

2 Freeze your norm first

What your site says, written down before you ask anything.

3 Ask three assistants, not one

Two that answer from memory, one from live search.

4 The four groups of questions

Company, founder, services, contact.

5 What counts as a finding

Wrong entity, stale fact, contradiction, silence.

6 Fix, wait, repeat

Recrawl, then the same questions two weeks later.

Run it yourself in an evening. No tools, no email, nothing to buy. Written after running it on my own site, where it found three problems in one evening.

Sergei Ponomarev, PhD · aibusiness.vc

1. Why a site check is not enough

Readiness audits measure whether your site *can* be read: lms.txt, schema, crawler access. What an assistant *says* about you is a different question, and the answer lives in the gap between what you published and what arrived.

2. Freeze your norm first

Write down what your site says: what you do, where you are, when you were founded, what you sell and at what price, how a stranger reaches you. That is what you compare against. Without it you are browsing answers, not testing them.

3. Ask three assistants, not one

Two that answer substantially from training, one built search-first that answers mostly from live retrieval. The disagreement between memory and retrieval is the diagnosis.

What you see	What it means
All three match your norm	Nothing to fix here
Retrieval-first right, others wrong	Live fix, memory not caught up
All three wrong the same way	The problem is still on your site
All three wrong differently	Nobody holds a stable picture of you

4. The four groups of questions

Fresh session per engine, so earlier answers do not steer later ones. Record them verbatim, with the date. Keep these four fixed; add your own on top.

- **The company.** What it does, where it is based, when it was founded.
- **The founder.** Who runs it, what they work on.
- **The services.** What is sold, to whom, at what price.
- **The contact.** How someone actually gets in touch.

5. What counts as a finding

Wrong entity: you are merged with a similarly named company. **Stale fact:** a price or claim you removed, quoted as current. **Contradiction:** your own files disagree and the machine picks one. **Silence:** something your site answers plainly, that no assistant can.

6. Fix, wait, repeat

Correct what you found, request a recrawl, then ask the same questions again after two weeks, wording unchanged. Retrieval answers can move within days; model memory takes far longer. Assistants are not deterministic, so one answer is an observation rather than a measurement.
